**FEATURES**

- **Wide input range:** 0 V to 1 V up to 0 V to 10 V
- **High CMV isolation:** 1500 V rms
- **Programmable output ranges:** 4 mA to 20 mA
- **Load resistance range:** 0 to 1.35 kΩ maximum
- **High accuracy**
  - Low offset tempco: ±300 nA/°C
  - Low gain tempco: ±50 ppm/°C
  - Low nonlinearity: ±0.02%
- **High CMR:** 90 dB minimum
- **Small package:** 0.7” × 2.1” × 0.35”
- **Meets IEEE Standard 472: transient protection (SWC)**

**APPLICATIONS**

- Multichannel process control
- DAC—current loop interface
- Analog transmitters and controllers
- Remote data acquisition systems

**GENERAL DESCRIPTION**

The 1B21 is an isolated voltage-to-current converter that incorporates a unique circuit design utilizing transformer-based isolation and automated surface-mount manufacturing technology. It provides an unbeatable combination of versatility and performance in a compact plastic package. Designed for industrial applications, it is especially suited for harsh environments with extremely high common-mode interference.

Functionally, the V/I converter consists of four basic sections: input conditioning, modulator, demodulator and current source (see Figure 1). The input is a resistor-programmable gain stage that accepts a 0 V to 1 V up to 0 V to 10 V voltage input. This maps into a 0 mA to 20 mA output or can be offset by 20% using the internal reference for 4 mA to 20 mA operation. The high level signal is modulated and passed across the barrier which provides complete input to output galvanic isolation of 1500 V rms continuous by the use of transformer-coupling techniques. Nonlinearity is an excellent ±0.05% maximum.

Designed for multichannel applications, the 1B21 requires an external loop supply and can accept up to 30 V maximum. This provides a loop supply compliance of 27 V, which is sufficient to drive a 1.35 kΩ load resistance.

The 1B21 is fully specified over −25°C to +85°C and operates over the industrial (−40°C to +85°C) temperature range.

**DESIGN FEATURES AND USER BENEFITS**

- **High CMV Isolation.** The 1B21 features high input to output galvanic isolation to eliminate ground loops and offer protection against damage from transients and fault voltages. The isolation barrier will withstand continuous CMV of 1500V rms and meets the IEEE Standard for Transient Voltage Protection (Std. 472-SWC).
- **Small Size.** The 1B21 package size (0.7” × 2.1” DIP) makes it an excellent choice in multichannel systems for maximum channel density. The 0.35” height also facilitates applications with limited board clearance.
- **Ease of Use.** Complete isolated voltage-to-current conversion with minimum external parts required to get a conditioned current signal. No external buffers or drivers are required.

$^1$ For 0 mA to 20 mA mode. For 4 mA to 20 mA mode, an additional 60 μA is contributed by the ±1.0% reference error on the 4 mA output.

$^2$ For a complete discussion of the temperature effects of the offset resistor and reference, refer to the Using the 1B21 section.
PIN CONFIGURATION

Figure 2. Pin Configuration
INSIDE THE 1B21

Referring to the functional block diagram (see Figure 3), the ±15 V power inputs provide power to both the input side circuitry and the power oscillator. The 25 kHz power oscillator provides both the timing information for the signal modulator and drives transformer T2 for the output side power supplies. The secondary winding of T2 is full wave rectified and filtered to create the output side power.

This maps the input voltage into a 4 V span. To create a 1 V offset at the output of the internal amplifier (4 mA at the output of the 1B21) a current derived from the reference can be fed into the summing node. The offset resistor (for a 1 V output offset) is given by the equation: \( R_o = 6.225 \, R_f \). For most applications, it is recommended that \( R_f \) be in the 25 k\( \Omega \) ±20% range. Resistor values for typical input and output ranges are shown in Table 2.

Adjustments

Figure 5 is an example of using potentiometers for trimming gain and offset for a 0 V to 5 V input and 0 V to 20 mA output. The network for offset adjustment keeps the resistors relatively small to minimize noise effects while giving a sensitivity of ±1% of span. For more adjustment range, resistors smaller than 274 k\( \Omega \) can be used. Resistor values from Table 2 can be substituted for other input and output ranges.

In general, any bipolar voltage can be input to the 1B21 as long as it is offset to meet the 0 V to −5 V constraint of the modulator and the input signal range is 1 V minimum.
**TC Considerations of External Resistors**

The specifications for gain and offset temperature coefficient (TC) for the IB21 excluded the effects of external components. The total gain TC for the circuit in Figure 4 is

\[
\text{Gain TC} = 1B21 \text{ Gain TC} + (\text{Tracking TC of } R_f \text{ and } R_i)
\]

The offset TC is also affected by the thermal stability of the internal voltage reference and its contribution is

\[
\text{Ref TC} = (V_{\text{REF}})(R_f/R_o)(4 \text{ mA/V})(\text{TC of } V_{\text{REF}} + \text{Tracking TC of } R_f \text{ and } R_o)/1 \times 10^6
\]

\[
\text{Total Offset TC} = 1B21 \text{ Offset TC} + \text{Ref TC}
\]

Specifically using \(R_f, R_i\) and \(R_o\) from Case 3 in Table 2, with absolute TCs of \(\pm 25 \text{ ppm}^\circ\text{C}\)

\[
\text{Gain TC} = 50 + (25 + 25) = 100 \text{ ppm}^\circ\text{C}
\]

\[
\text{Offset TC} = 300 + (6.225 \text{ V})(20k/124.3 \text{ k})(4 \text{ mA/V})
\]

\[
(20 + 25 + 25)/1 \times 10^6 = \pm 580 \text{ nA}^\circ\text{C}
\]

Similarly, when using a resistor network with a tracking spec of \(\pm 5 \text{ ppm}^\circ\text{C}\), the total gain TC is \(\pm 55 \text{ ppm}^\circ\text{C}\) and the total offset TC is \(\pm 400 \text{ nA}^\circ\text{C}\).
APPLICATIONS INFORMATION

OUTPUT PROTECTION

In many industrial applications, it may be necessary to protect the current output from accidental shorts to ac line voltages in addition to high common-mode voltages and short circuits to ground. The circuit shown in Figure 6 can be used for this purpose. The maximum permissible load resistance will be lowered by the fuse resistance (typically 8 Ω) when protection circuitry is utilized.

![Figure 6. Output Protection Circuitry](image)

LOW DRIFT INPUT NETWORK

Figure 7 shows a configuration suitable for applications where errors have to be minimized over a wide temperature range. A temperature tracking network such as a 50 k Beckman (PN 698-3R50KD) can be used to implement both offset and gain for either 0 mA to 20 mA or 4 mA to 20 mA current loops. For 0 V to 10 V signals either IN1 or IN2 can be used for input. For 0 V to 5 V signals, jumper In1 to In2. Similarly, for 4 mA to 20 mA operation the 4 mA node should be jumpered to OFFSET, while for 0 mA to 20 mA it should be tied to COM.

![Figure 7. Low Tempco Resistor Network Configuration](image)

MULTILOOP ISOLATION

Multiple 1B21s can be connected to a single loop supply in parallel as shown in Figure 8. The amperage of the loop supply should be sufficient to drive all the loops at full-scale output.
